

6. Precautions for using RPi

1. It is forbidden to short-circuit the pins of the Raspberry Pi, especially VCC and GND. A short-circuit will cause the chip to burn out and become unrecoverable.
2. It takes tens of seconds for the Raspberry Pi to start up. Do not turn off the power within 1 minute after turning on the power, which will affect the service life of the Raspberry Pi.
3. When the SD card burning system is completed, the system will prompt you to format it. There is no need to format it at this time, just click Cancel. If you click format, the Raspberry Pi will prompt that files are missing and you need to re-burn the system.
4. Raspberry Pi 4B has two micro-HDMI interfaces (hdmi0 and hdmi1), which can connect to two monitors.

If you only connect one monitor, you must plug it into the HDMI0 interface, which is the one close to the type-C power interface, so that it can display normally;

If only the HDMI1 interface is plugged in, the monitor will not be able to display.

Note: Please make sure the HDMI cable is connected correctly, otherwise it will damage the HDMI interface on the Raspberry Pi board.
